

Yang Chi

215 E 96 St Apt 24, New York, NY 10128 , 513-679-0772

Email: yang@yangchi.me , Github: <https://github.com/yangchi>

EXPERIENCE

03/2015 - present: Software Engineer, Facebook

I work in the Traffic team at Facebook. Specifically I work on the client side network stacking used by Facebook, Messenger and Group apps in both iOS and Android systems

12/2013 - 03/2015: Software Engineer, Cisco Systems

I work in the Core Software Group (CSG) at Cisco. Specifically I work on network policy infra across many platforms on Cisco IOS systems.

EDUCATION

09/2008 - 12/2013: Ph.D. in Computer Science & Engineering, University of Cincinnati

Dissertation: Effective Use of Network Coding in Multi-hop Wireless Networks

09/2004 - 04/2008: B.S. in Network Engineering (CS equivalent), Chongqing University

SKILLS

- Programming Languages: C, C++, Java, Python
- Experience: Mobile programming in both iOS and Android, Linux/Unix programming, Network Simulation (ns-3), OpenFlow and SDN, RESTful API, SDN, Web Development
- Strong background in Computer Networks and TCP/IP Protocols and solid knowledge in Operating Systems, Distributed Computing, Algorithms and Data Structure. Fundamental knowledge in databases

RESEARCH WORKS

Network Coding in Multi-Radio Networks: Design and implement an opportunistic and independent 2.5 layer protocol for network coding in multi-radio networks. First distributed and practical solution to this problem. Implemented in ns-3 with C++. Throughput gain in some cases can be 10%. Latency gain around 50% is also achieved.

Publication: *Murco: An Opportunistic Network Coding Framework in Multi-Radio Networks, IEEE ICC 2012, first author*

Practical Coding-Aware Routing Protocols: Propose and design a new routing metric ETOX and a hybrid routing protocol HyCare for network coding capable networks. Implemented in ns-3 with C++. Achieve around 100% throughput gain compared to classical routing protocols with network coding in wireless mesh network backbone.

Publication: *HyCare: Hybrid Coding-Aware Routing with ETOX Metric in Multi-hop Wireless Networks, to appear at IEEE MASS 2013, first author*

Network Locality in Wireless Networks: This is the first validation of network locality in both WLAN and mesh networks. Created packet parser in Python to analyze more than 1.3 billion packets (more than 130GB of data) collected from both real network traces and simulations.

Publication: *Network Locality in Wireless Networks, ACS/IEEE AICCSA 2013, first author*

Decoding-Delay Sensitive Coding Scheme in TCP: Design a novel coding scheme for network-coded TCP to solve the decoding delay problem in such TCP implementations. 10% throughput increase and even more significant end-to-end delay reduce compared to previous similar algorithm.

Paper: *TCP-Forward: Fast and Reliable TCP Variant for Wireless Networks*

OTHER EXPERIENCE

Web Developer University of Cincinnati, 04/2012 - 06/2013: Implement E-Portfolio system, an online portfolio and assessment platform, for College of Engineering and Applied Sciences at University of Cincinnati using PHP and MySQL.
